

## 32-bit ARM® Cortex-M4F based auto-grade MCU with LDO, integrated 2-phase/3-phase pre-driver with supply up to 28V

Revision A/11 – July 2023

### Features

- 32-bit ARM® Cortex-M4F CPU with FPU
  - 100 MHz maximum frequency
- Memories
  - Up to 128 KB embedded flash
  - Up to 1 KB emulated EEPROM
  - Up to 32 KB on-chip SRAM
- Power Management
  - Single battery supply from 5.5V to 28V (42V for load dump).
  - Integrated 3.3V and 5V LDO for MCU and main I/O supply
  - Integrated 5V LDO for external sensor
  - Sleep mode and stop mode for power saving
  - POR, Brown-out detector (BOD)
- Pre-Driver Module
  - 2-Phase/3-Phase Pre-Driver for motor control
  - Integrated charge pump for 100% duty cycle
  - Programmable driving capability up to 290mA
  - Programmable output swing from 8V to 11V
  - Four/Six external power FET  $V_{DS}$  monitors
- Clock
  - Crystal oscillator with both internal oscillator and external clock input support
  - Internal 32MHz factory-trimmed oscillator
  - Internal 32MHz backup-safety oscillator
  - PLL for CPU clock, maximum up to 100MHz
- 8-channel DMA controller
- 13-bit A/D converter (up to 9 channels)
  - As low as 200 ns conversion time
  - Single-ended and differential sampling
  - Open/short detection for safety
- Three temperature sensor
  - 1 x T-sensor for MCU
  - 1 x T-sensor for PMU
  - 1 x T-sensor for LIN transceiver
- Monitoring ADC (13-bit)
  - Monitor critical voltages
- Programmable gain amplifier (PGA)
  - One single-ended PGA with gain option: 1, 2, 4, 8, 16, 32, 48, 64
  - One differential PGA with gain option: 2, 4, 8, 16, 24, 32, 48, 64
  - Differential PGA supports -1.5V ~+2V input
- Analog comparator
  - Two (one pair) high-speed comparators with digital deglitch filter
- Integrated phase voltage comparison
  - 3-phase voltage sensing and 1-reference sensing
  - 3 dedicate phase comparator
- Three 10-bit DACs and 1 DAC buffer
- One D2S (Differential to single-ended) buffer
- LIN transceiver compatible with LIN spec 2.2A and SAEJ2602-2
- 1 input with high voltage monitoring

- PWM
  - Four enhanced PWM modules
  - 8 PWM outputs in total
  - Flexible waveform generation with phase lead/lag control
  - All events can trigger ADC conversion
- Up to 27 GPIO Pins
  - Configurable pull-up/pull-down resistors
  - Up to 9 GPIO with 3.3V
  - Up to 18 GPIO with 5V
  - Programmable digital input deglitch filter
- Enhanced Capture Module (ECAP)
  - Flexible input capture pin
  - Four 32-bit capture registers
  - Capture and APWM mode selection
- Debug mode
  - Serial wire (SW) debug & JTAG interfaces
- 6 Timers
  - Three 32-bit general-purpose timers
  - Two 32-bit watchdog timers
  - SysTick timer 24-bit down-counter
- Communication interfaces
  - UART (with LIN support) x 2, An external LIN PHY required for UART1
  - SPI x 2
  - I2C x 1
  - CAN (with FDCAN support) x 1
- Security Modules
  - 64-bit unique ID, CRC x 1
- Operating temperature
  - SPD1179  
Junction temperature: -40 to +150 °C  
Automotive AEC-Q100 Grade 1 class
  - SPD1176  
Junction temperature: -40 to +125 °C  
Industrial grade

# 1 Device overview

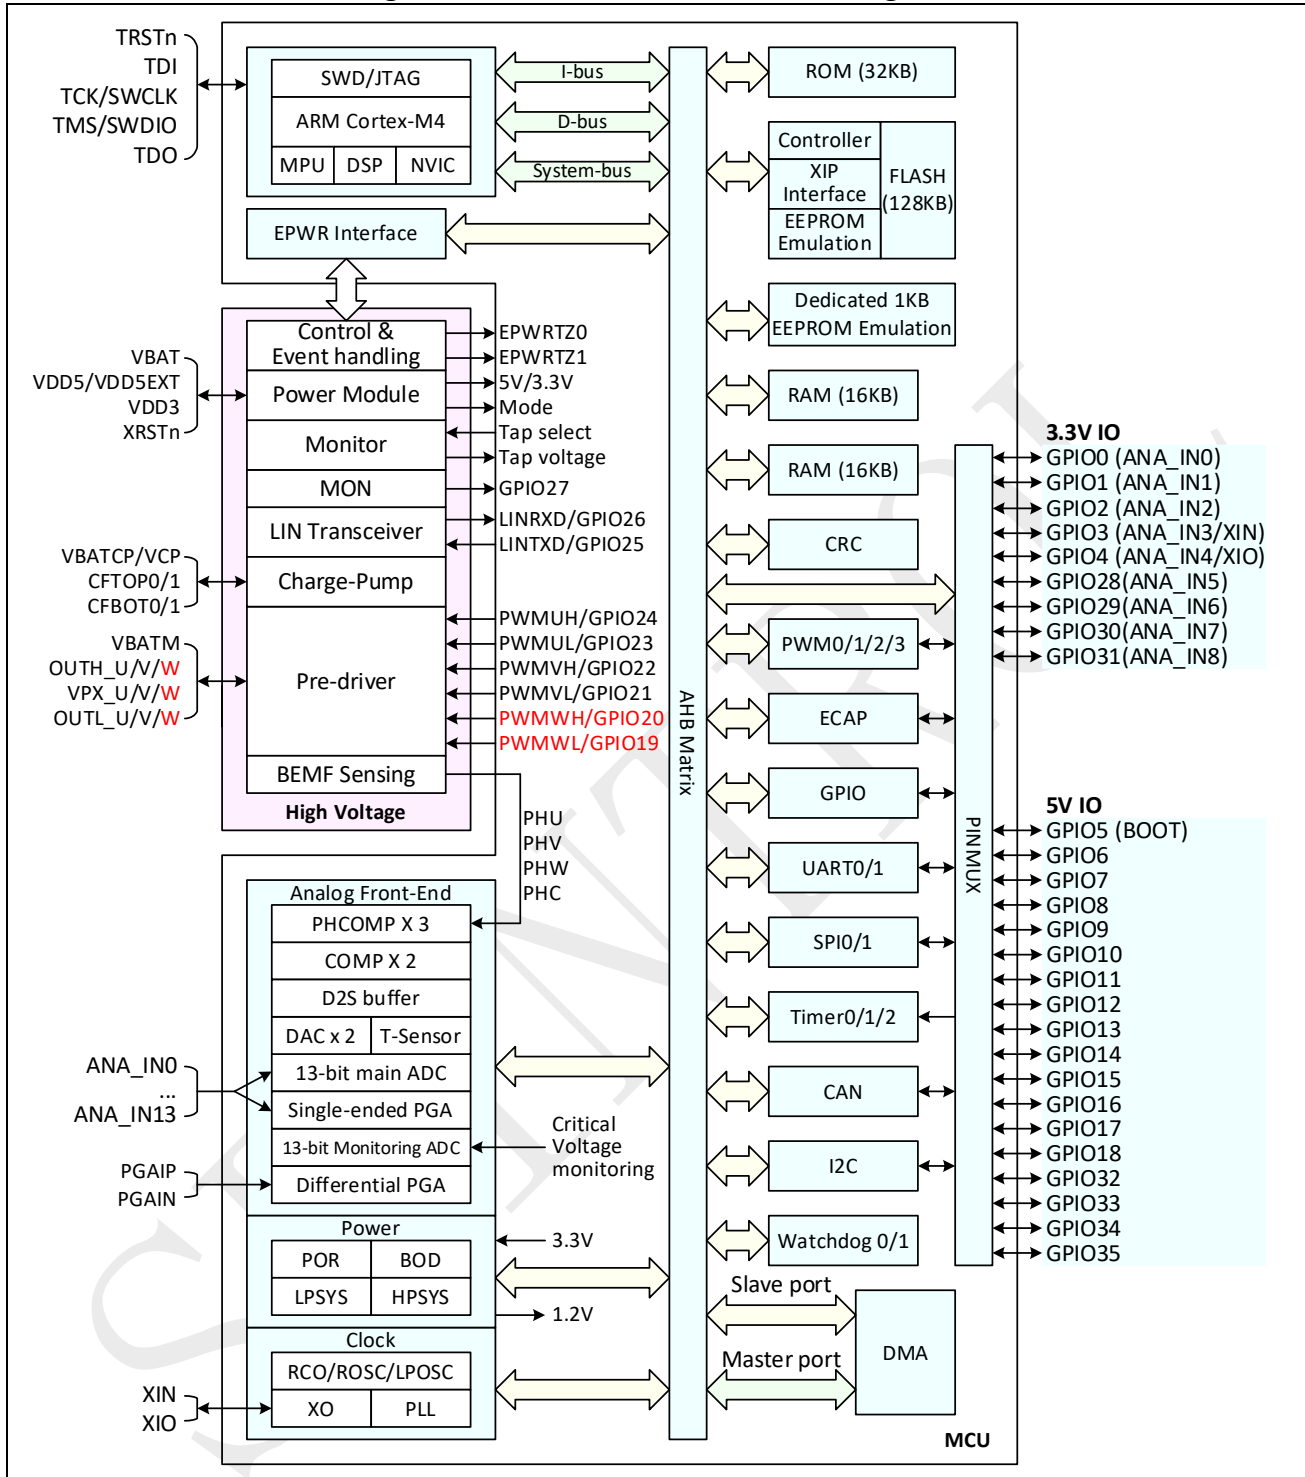

The SPD1179 device from Spintrol is a highly integrated system-on-chip (SoC) microcontroller. The SPD1179/SPD1176 incorporates a 32-bit ARM® Cortex-M4F high-performance processor with a software-programmable clock rate up to 100 MHz, 32 KB SRAM, 128 KB embedded flash with up to 1 KB EEPROM emulated by extra 12 KB flash, and an extensive range of enhanced I/Os and peripherals. The device offers a 13-bit ADC, one differential PGA and one single-ended PGA, four enhanced PWMs, three general-purpose 32-bit timers, as well as standard and advanced communication interface: two UARTs with LIN support, two SPIs, one I2C and one CAN.

The SPD1179/SPD1176 operates with a single power supply from 5.5V to 28V (42V for load dump) and supports stop/sleep mode for power saving. It integrates two 5V LDOs for internal power system and external sensor, and also integrates 3.3V and 1.2V LDOs for MCU operation. It supports 5V I/O for logic and 3.3V I/O for analog input channel. The junction temperature range is from -40 °C to +150 °C. The package type is 48-pin or 56-pin wettable flank QFN.

The SPD1179/SPD1176 employs function safety features such as backup clocking scheme, watchdog timer interrupt and reset, open/short detection and background critical voltage monitoring. All these features make the SPD1179/SPD1176 ideal for motor control in automotive application.

[Figure 1-1](#) shows the functional block diagram for the SPD1179/SPD1176. [Figure 1-2](#) shows the application diagram. [Figure 1-3](#) shows the clock tree information.

## 2 Feature descriptions

### 2.1 ARM® Cortex-M4F core

The ARM® Cortex-M4F processor has been developed to provide a low-cost platform that meets the needs of MCU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced system response to interrupts.

The SPD1179/SPD1176 integrates a full-feature ARM® Cortex-M4F core that can run up to 100MHz. Therefore, it is compatible with all ARM tools and software.

### 2.2 Serial wire and JTAG debug port (SWJ-DP)

The embedded ARM® SWJ-DP interface is combined by JTAG and serial wire debug port. They are connected to the external I/O port as shown in [Table 2-1](#). The debug port can be disabled when enabling SPD1179/SPD1176 certain security feature.

**Table 2-1: Debug interface definition**

Pin Name	Serial wire mode (Disable SWV)	Serial wire mode (Enable SWV)	JTAG mode
GPIO15	User specified function channel	User specified function channel	TDI
GPIO16	User specified function channel	SWV	TDO
GPIO17	SWD	SWD	TMS
GPIO18	SWCK	SWCK	TCK

[1] The purpose of setting GPIO16 through the 24<sup>th</sup> bit of ARM® Cortex-M4F register (CoreDebug->DEMCR) located at address 0xE000EDFC: 1—SWV output; 0—function specified by user through software.

*Note: In debug mode, TRSTn must be tied to the logic high(5V).*

### 2.3 Boot ROM

The Boot ROM contains boot code, Flash software library code and emulated EEPROM software library code. User can call these software library to access the Flash memory and the emulated EEPROM directly.

### 2.4 Embedded SRAM

The SPD1179/SPD1176 has implemented 32 KB SRAM memory for code and data. The SRAM can be accessed (read/write) at CPU clock frequency with 0 wait states.

### 2.5 Embedded Flash memory

Up to 128 KB of embedded Flash memory is available for storing programs and data. To enhance the lifetime and store critical data, another 12 KB Flash memory is used for EEPROM emulation to support up to 1 KB effective capacity.

### 2.6 Nested vectored interrupt controller (NVIC)

The SPD1179/SPD1176 embeds a nested vectored interrupt controller able to handle up to 54 maskable interrupt channels (not including the 16 interrupt lines of Cortex-M4F) and 16 programmable priority levels.

- Closely coupled NVIC gives low-latency interrupt processing

- Interrupt entry vector table address passed directly to the core
- Processing of *late arriving* higher priority interrupts
- Support for tail-chaining
- Support for lazy-stacking
- Interrupt entry restored on interrupt exit with no instruction overhead

## 2.7 External interrupt/event controller

The SPD1179/SPD1176 provides a flexible external pin interrupt or event trigger mechanism. Any GPIO pin can be programmed as an external interrupt or event trigger source. In addition, any GPIO interrupt can be configured as edge-triggered or level-triggered.

## 2.8 Power supply and Reset

The SPD1179/SPD1176 supports single power supply (VBAT) from 5.5V to 28V, which powers internal voltage regulators, analog circuitry on chip and the IOs. In addition, for 42V supply, chip will survive for load dump. There are no special power-up sequence requirements for the SPD1179/SPD1176.

The SPD1179/SPD1176 supports 5V I/O capability for GPIO5 ~ GPIO18/GPIO32 ~ GPIO35 and 3.3V I/O capability for GPIO0 ~ GPIO4//GPIO28 ~ GPIO31.

The SPD1179/SPD1176 has a global reset pin as well as an integrated power-on reset (POR) circuitry. The POR circuitry guarantees all power-up reset sequence requirements and makes the device easy to use.

## 2.9 Brown-out detector

The device features an embedded brown-out detector (BOD) that monitors the power supply and different domain power (VBAT/DVDD5/DVDD5EXT/DVDD33/VCAP12) and compare them to the programmable threshold. An interrupt or reset can be generated when voltage of the power domain is above the up-boundary or below the low-boundary. The interrupt service routine then generates a warning message and/or put the MCU into a safe state.

## 2.10 Clocks

System clock selection is performed on startup. The internal 32 MHz factory-trimmed oscillator is selected by default upon reset. External crystal with frequency from 4MHz to 32MHz can be attached to GPIO3 and GPIO4, so as to generate high precision clock using on-chip crystal oscillation circuits. User can also directly use external clock via GPIO3.

The device implements a fractional phase-lock loop (PLL) for high frequency clock generation. The PLL can take the internal 32MHz oscillator or external clock as the input reference. The output frequency covers from 25MHz to 100MHz.

Several clock dividers allow the configuration of the AHB, and the peripherals frequency. The maximum allowed frequency is 100MHz. See [Figure 1-3](#) for details on the clock tree. Special clock selection logic is designed so that the backup clock can take charge if current clock is missing. The 32MHz backup-safety oscillator makes the SPD1179/SPD1176 get rid of clock stuck.

## 2.11 Power management unit

The power management unit generates all the required supplies for the embedded MCU (DVDD5, DVDD33, VCAP12) and external supply (VDD5EXT). The power management system ensures safe behavior of SPD1179/SPD1176, and has a state machine to control power modes transition. The SPD1179/SPD1176 has implemented the power management module with following features:

- Support three power modes (active, stop and sleep)
  - Active mode
 

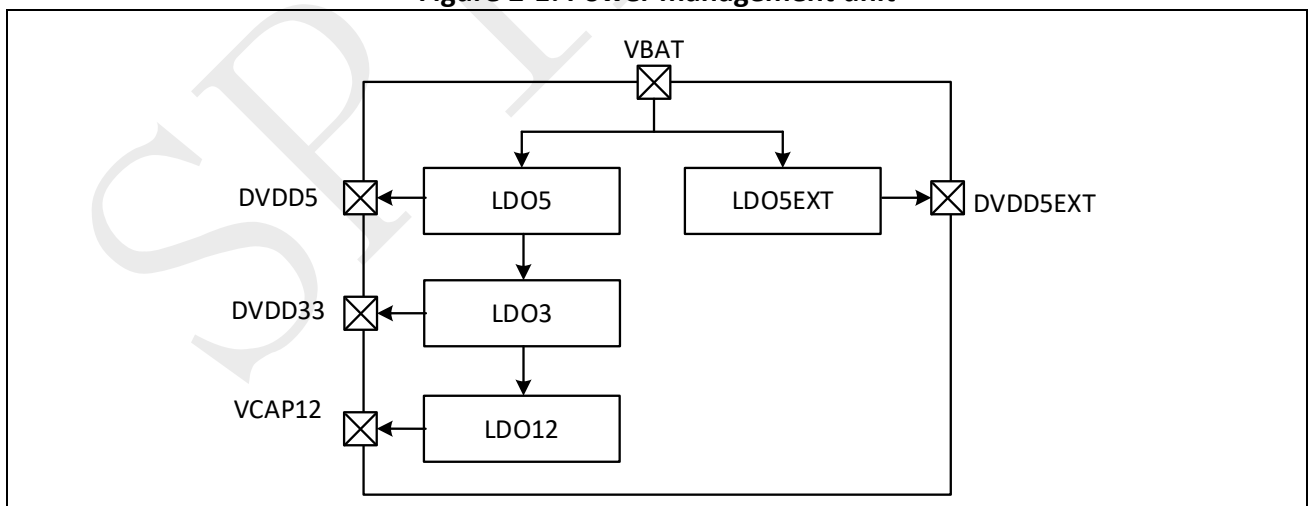

The voltage regulators (DVDD5, DVDD33, VCAP12) are supplied by on-chip LDO with full current driving capability. All clocks are enabled per user's setup in register control bits.
  - Stop mode
 

All clocks are stopped except for the 100 KHz clock for power mode state machine. DVDD5, DVDD33, VCAP12 are supplied by low-power LDO with limited current driving capability. VCAP12 can be configured to be below 1.2V to further reduce the static current. All registers and memories retain the content. The system can be waken-up by different wake-up sources, like XRSTn, LIN, MON, cyclic-wakeup and cyclic-sense-wakeup by any GPIO per user's setup with programmable input levels. The CPU will continue to run the instructions when it exit stop mode (XRSTn wake-up will trigger system reset).
  - Sleep mode
 

The voltage regulators (DVDD5, DVDD33, VCAP12) are totally shutdown. It can be waken-up by LIN/MON/cyclic-wakeup and the whole system will go through a cold start-up.
- The voltage regulators (DVDD5, DVDD33, VCAP12 and VDD5EXT) supports over-current, over/under-voltage protection
- Provide over-temperature protection
- Configurable wakeup sources (LIN, MON, cyclic wakeup, cyclic sense wakeup, GPIOs)

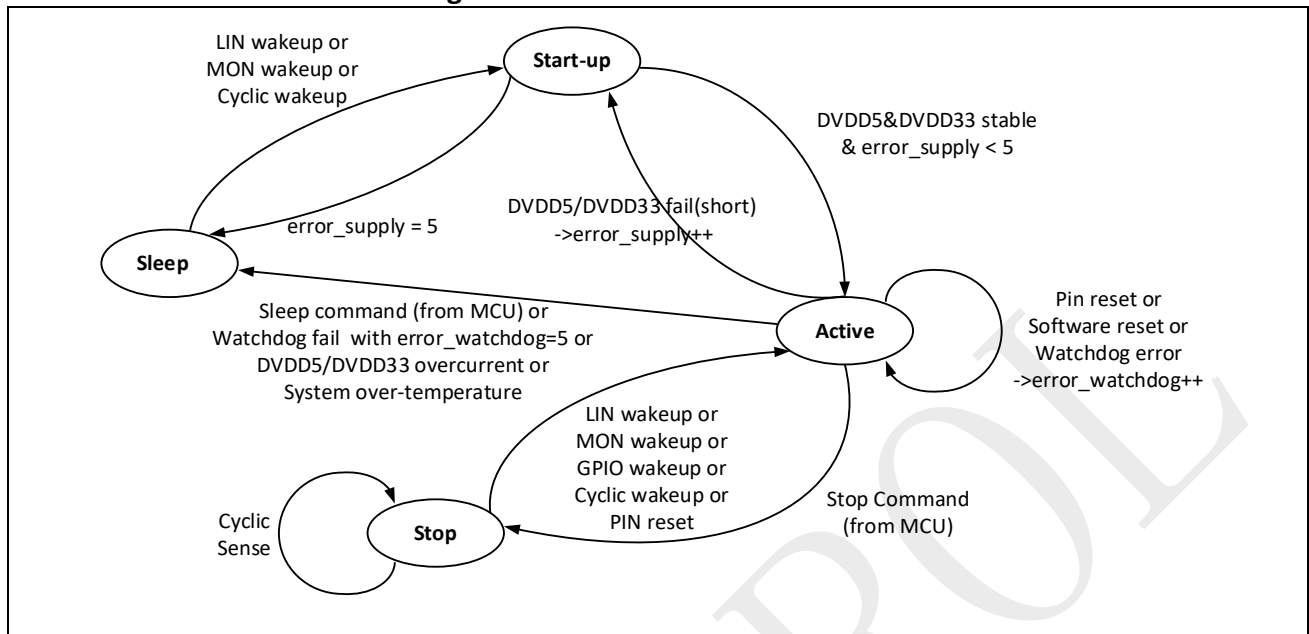

The power system diagram is shown in [Figure 2-1](#).

**Figure 2-1: Power management unit**

The three power modes transition is shown in [Figure 2-2](#).

**Figure 2-2: Power modes transition**

## 2.12 DVDD5 LDO

The DVDD5 LDO provides power for 5V domain functions. The SPD1179/SPD1176 has implemented a DVDD5 LDO module with following features:

- 5V LDO with 80mA driving ability
- Overcurrent monitoring and self-shutdown
- Pre-regulator for DVDD33 LDO
- Pull down current source (typically 5mA) at the output for sleep mode only

## 2.13 DVDD33 LDO

The DVDD33 LDO provides power for 3.3V domain functions. The SPD1179/SPD1176 has implemented a DVDD33 LDO module with following features:

- 3.3V LDO with 50mA driving ability
- Overcurrent monitoring and self-shutdown
- Pre-regulator for VCAP12 LDO
- Pull down current source (typically 100uA) at the output for sleep mode only

## 2.14 DVDD5EXT LDO

The DVDD5EXT LDO provides power for external circuits. The SPD1179/SPD1176 has implemented a DVDD5EXT LDO module with following features:

- 5V LDO with 40mA driving ability
- Overcurrent monitoring and self-shutdown
- Pull down current source (typically 100uA) at the output for sleep mode only

## 2.15 VCAP12 LDO

The VCAP12 LDO provides power for the embedded MCU. The SPD1179/SPD1176 has implemented a VCAP12 LDO module with following features:

- 1.2V LDO with 40mA driving ability

## 2.16 Power tracking amplifier

Power tracking amplifier buffers critical power signals to the 13-bit Monitoring ADC, to monitor power status. The critical power signals sent to the 13-bit Monitoring ADC are VBAT, VCP, VMON, VDD5, power bandgap, PMU temperature sensor voltage and LIN temperature sensor voltage.

## 2.17 Boot mode

The boot code is located in on-chip ROM memory. After reset, the ARM processor starts code execution from the ROM.

- If GPIO5 is high upon power-on reset, XRSTn pin reset or the system reset request from the ARM® Cortex-M4F, ISP boot mode is entered. The boot loader reprograms the embedded Flash by using UART or LIN interface. When UART interface is used, GPIO10 is configured as UART0\_TXD and the GPIO11 is configured as UART0\_RXD.
- For all other cases, the boot loader jumps to the embedded Flash and runs from the address at 0x1000 0000.

## 2.18 General-purpose IOs (GPIOs)

The SPD1179/SPD1176 can be configured to support as many as 27 multi-purpose GPIO pins. Each GPIO pin can be configured by software as input, as output or as peripheral alternate function. It features:

- Each GPIO pin has configurable internal pull-up and pull-down resistors
- Each GPIO pin has a programmable digital input deglitch filter
- Pure 3.3V I/O capability multiplexed with ADC input channel for GPIO0~GPIO4, GPIO28 ~ GPIO31
- Full 5V I/O capability for GPIO5 ~ GPIO18, GPIO32 ~ GPIO35

## 2.19 General Purpose Timers

The SPD1179/SPD1176 includes three identical general-purpose timers, which features:

- Independent clock enable control
- 32-bit auto-reload down-counter
- Generate interrupt request, ADCSOC event and PWMSYNC event when the counter reaches zero
- Support 4 modes
  - General timer: Periodic down-counter
  - Gated timer: Down-counter enabled by external input level
  - Event counter: Down-counter upon external input edge
  - Event capture: Down-counter with timestamp latched upon external input edge

## 2.20 Watchdog timer

The SPD1179/SPD1176 implements two identical watchdogs, which features:

- Independent clock source, clock dividing and clock enable control
- 32-bit auto-reload down-counter
- Generate interrupt request when the counter reaches zero
- Generate reset request when the counter reaches zero and the interrupt flag is already set
- Can be frozen or free-running in debug mode

## 2.21 SysTick timer

There is a SysTick timer embedded in the ARM® Cortex-M4F. It is dedicated for OS, but could also be used as a standard down-counter. It features:

- A 24-bit down-counter with auto-reload capability
- Maskable system interrupt generation when the counter reaches 0

## 2.22 UART

The SPD1179/SPD1176 has two UART modules that are functionally compatible with the 16550A and 16750 industry standards. They features:

- Ability to add or delete standard asynchronous communication bits (start, stop and parity) in the serial data
- 5 – 8 data bits
- Even, odd or no parity detection
- One, one-and-a-half, or two stop bits generation
- Baud-rate generation up to 6.25 Mbps
- 64-byte transmit FIFO
- 64-byte receive FIFO
- Auto baud-rate detection

Specific hardware is also implemented to enable LIN features:

- Compatibility with LIN 1.3, 2.0, 2.1 and 2.2A protocols
- Configurable baud rate up to 20 kbps
- Identification masks for message filtering
- Hardware processing on break field, sync byte field, protected ID field, data field and checksum field
- Response length can be defined by bit 5 and bit 4 of protected ID field, or by register control
- Programmable classic checksum mode or enhanced checksum mode

## 2.23 I<sup>2</sup>C

The I<sup>2</sup>C bus interface complies with the common I<sup>2</sup>C protocol and can operate in standard mode (with data rates up to 100 Kb/s) and fast mode (with data rates up to 400 Kb/s). It features:

- Three speeds: Standard mode (100 Kb/s), Fast mode (400 Kb/s) and High-Speed mode (2 Mb/s)
- Clock synchronization
- Master or slave I<sup>2</sup>C operation
- 7- or 10-bit addressing
- 7- or 10-bit combined format transfers
- 16 x 32-bit deep transmit and receive buffers, respectively

## 2.24 SPI

SPD1179/SPD1176 includes two SPI modules, which allow half/full-duplex, synchronous, serial communication with external devices. They features:

- Full-duplex synchronous transfers
- Master or slave operation
- 1 to 32-bit transfer frame format selection
- Local clock divider for flexible communication speed control, with up to 50 Mbps capability
- MSB-first data order
- Programmable clock polarity and phase
- 16 x 32-bit deep transmit and receive FIFOs, respectively

## 2.25 CAN

The SPD1179/SPD1176 has implemented one CAN module. It is used for communication based on CAN protocol. An external CAN transceiver is required for the connection to the physical layer (CAN bus). The CAN module features:

- Compatible with ISO-11898-1:2015 specification, whose frame format is called classical CAN and ISO-FDCAN.
- Compatible with Bosch CAN2.0B specification.
- Compatible with Bosch FDCAN V1.0 specification, whose frame format is called NONISO-FDCAN.
- Support Bus-Off recovery.
- Support automatic message re-transmission after transmission failure.
- Support restricted mode.
- Support monitor mode.
- Support test mode.
- Support 64 mailboxes with independent message identifier mask for each mailbox.
- Support automatic remote frame handling.
- Support CAN bus error recording.
- Support 32-bit timestamp.

**Note:** *The CAN module of SPD1179/SPD1176 does not support wake-up function, users need to select a CAN PHY that supports wake-up function and connect the CAN PHY wake-up signal to the MON pin or GPIO pin of SPD1179/SPD1176 to realize the CAN wake-up function.*

## 2.26 ADC

One 13-bit analog-to-digital convert is embedded into SPD1179/SPD1176 and has up to nine external channels. The temperature sensor, internal powers and PGA outputs can be selected as ADC input channels. These inputs are multiplexed. The ADC core has built-in sample-and-hold (S/H) with two input channels, which is suitable for differential sampling. The start of sample and conversion can be triggered by the software, the internally connected hardware event signals from the general-purpose timers and the PWM outputs, or from the external pin input.

The 13-bit ADC features:

- 200 ns minimum conversion time and independent configurable sampling time
- Support single-ended or differential sampling
- Full range analog input: 0 V to 3.65 V
- Input open and short detection for safety

Another 13-bit ADC (Monitoring ADC) is provided to routinely check critical voltages below per user's request for system safety concern. An interrupt can be generated if the monitoring item is out of the pre-defined range.

Please see [Table 5-19](#) for 13-bit ADC characteristics and [Table 5-20](#) for Monitoring ADC characteristics.

## 2.27 Temperature sensor

SPD1179/SPD1176 includes three temperature sensors. One for MCU, one for PMU in high voltage and one for LIN transceiver. Their sensing voltages vary linearly with temperature. These sensing signals are internally connected to the input channel of monitoring ADC, which is used to convert the sensor output voltage into a digital value.

## 2.28 PGAs

SPD1179/SPD1176 includes a differential programmable gain amplifier (DPGA) with two dedicated pins. It features:

- Programmable gains: 2, 4, 8, 16, 24, 32, 48 and 64
- Differential input voltage:  $\pm 2.7/\text{PGA\_Gain}$
- Wide common mode input range: -1.5V ~ 2V with Gain 2x
- Settling time: 250 ns to 1.4 us

A single-ended PGA (SPGA) is also implemented in SPD1179/SPD1176. The four external ADC input channels (ANA\_IN0~ANA\_IN3), the temperature sensor output, and internal 1.2V power can be selected as the SPGA input. It features:

- Programmable gains: 1, 2, 4, 8, 16, 32, 48 and 64
- Settling time: 300 ns to 2 us

Both the outputs from the differential PGA (DPGA) and the single-ended PGA (SPGA) can be selected as the 13-bit ADC input. Please see [Table 5-22](#) for DPGA characteristics and [Table 5-23](#) for SPGA characteristics.

## 2.29 Analog comparators

The SPD1179/SPD1176 has two high-speed comparators. They are used with two internal 10-bit DAC as reference for monitoring PGA inputs or outputs to check whether the voltage is too high or too low. The comparator output is routed to the PWM Trip-Zone modules.

- 50 ns typical response
- Programmable hysteresis
- Output with digital deglitch filter

Please see [Table 5-24](#) and [Table 5-26](#) for analog comparator and DAC characteristics.

## 2.30 Phase comparators

SPD1179/SPD1176 include 3 high speed rail-to-rail phase comparators, which can compare three phases voltage (PHU/PHV/PHW) to the common mode voltage (PHC). Phase comparator has 8-to-1 input mux, it can also used as normal comparator to compare analog ADC input to reference voltage (ADC input or DAC output).

Based on the intrinsic characteristic of motor operation, hardware post-processing is implemented to the comparator output as below, so as to simplify user's software.

- Blanking with programmable window size
- Filtering with programmable window size
- Finite state machine (FSM) to ignore the systematic false alarm due to the large interferences via motor toggling. The FSM can be reset to initial state per user's software. The first zero-crossing event after the FSM reset is ignored.

## 2.31 DAC and DAC buffer

The SPD1179/SPD1176 has three 10-bit DAC, which can generate a voltage from 0 to VDDA. DAC0 and DAC1 can be used as too high or too low reference for comparators. DAC2 can be used as the reference of phase comparator.

The SPD1179/SPD1176 has one DAC buffer, it can select DAC0 or DAC1 as its input, and send output through ANA\_IN2 pin.

## 2.32 D2S buffer

The SPD1179/SPD1176 integrates one D2S (differential to single-ended) buffer, which can convert DPGA's differential output voltage to single-ended output voltage and sent it to ANA\_IN4 pin. Through external RC filter (typically,  $R = 1k\Omega$ ,  $C = 1\mu F$ ), the single-ended output voltage can be sent back to ANA\_INx ( $x = 0 \sim 3$ ) pin and measured by 13-bit ADC. D2S buffer gain is fixed at 0.5.

## 2.33 PWMs

The SPD1179/SPD1176 integrates four PWM modules and supports six PWM channels. Without much involvement of processor core, the PWMs can generate complex pulse width waveforms.

Each PWM module supports the following features:

- Dedicated 16-bit time-base counter with period and frequency control
- Each PWM module can generate two outputs with single-edge operation, dual-edge symmetric operation or dual-edge asymmetric operation
- All events can trigger both CPU interrupts and ADC start of conversion
- Programmable phase-control support for lag or lead operation relative to other PWM modules
- Dead-band generation with independent rising and falling edge delay control
- Programmable trip zone allocation of both cycle-by-cycle trip and one-shot trip on fault conditions
- A trip condition can force either high, low, or high-impedance state logic levels at PWM outputs
- Comparator module outputs and trip zone inputs can generate events, filtered events, or trip conditions

## 2.34 ECAP

The enhanced capture (ECAP) module is essential in systems where accurate timing of external events is important. The SPD1179/SPD1176 has implemented an ECAP module with following features:

- Flexible input capture pin: each GPIO can be configured as capture pin
- 32-bit time base counter
- 4 x 32-bit time-stamp capture registers
- 4-stage sequencer that is synchronized to external events
- Independent edge polarity (rising/falling edge) selection for all 4 events
- Interrupt capabilities on any of the 4 capture events

## 2.35 Cyclic redundancy check (CRC)

The SPD1179/SPD1176 has a hardware CRC calculation unit. The CRC module is used to verify data transmission or storage integrity. It features:

- 32-bit parallel bit stream input, and up to 32-bit CRC output
- Supports up to  $2^{32}$  byte length for CRC calculation
- Eight CRC standard polynomials supported

## 2.36 Pre-Driver System

Pre-Driver system consists of a two/three low-side and high-side pre-drivers which can drive the two/three phases of low-side and high-side external power NFET's. The SPD1179/SPD1176 has implemented this Pre-Driver system with following features:

- Embedded dual charge pump guarantees 100% duty cycle
- High performance down to 5.5V supply
- Built in non-overlap time to prevent crow-bar current even in case of input PWM overlapping
- Dynamically adjustable Pre-Driver charge/discharge strength to optimize switching and EMI
- VDS monitors for short circuit detection in on- and off-state

## 2.37 LIN transceiver

The local interconnect network (LIN) module is a serial communication protocol designed to support automotive networks in conjunction with controller area network (CAN). As the lowest level of a hierarchical network, LIN enables cost-effective communication with sensors and actuators when all the features of CAN are not required.

The SPD1179/SPD1176 has implemented an LIN module (connected to UART1 internally) with following features:

- Operational with VBAT 7.0 to 18 V DC, functional up to 28 V and down to 5.5V. For load dump, VBAT can survive up to 42V.
- Support 2 transmission modes 10.4kBaud/20kBaud, functional download with 115.2kBaud
- Integrated 30kΩ termination resistor for slave applications
- Compatible with LIN protocol specification 2.2, and SAEJ2602-2
- Low standby current in Sleep mode
- Over-temperature protection
- TxD timeout feature (optional, enabled by default)
- Very high immunity against electromagnetic interference

## 2.38 High voltage monitor

The high voltage monitor (MON) module is dedicated to monitor external high voltage levels above or below a specified threshold (normally is VBAT/2). Its output can be used as an digital level from high voltage pin or used to detect a wake-up event at the high-voltage MON pin in low-power mode.

The SPD1179/SPD1176 has implemented an MON module with following features:

- High voltage input with VBAT/2 threshold voltage
- Integrated pull-up and pull-down current sources with automatic selectable capability
- Wake-up event for power saving modes
- Level shift from high voltage pin to low voltage domain

## 2.39 BEMF sensing

The back electromotive force (BEMF) sensing module is used to detect zero crossing events, which can be used as a commutation trigger for BLDC applications.

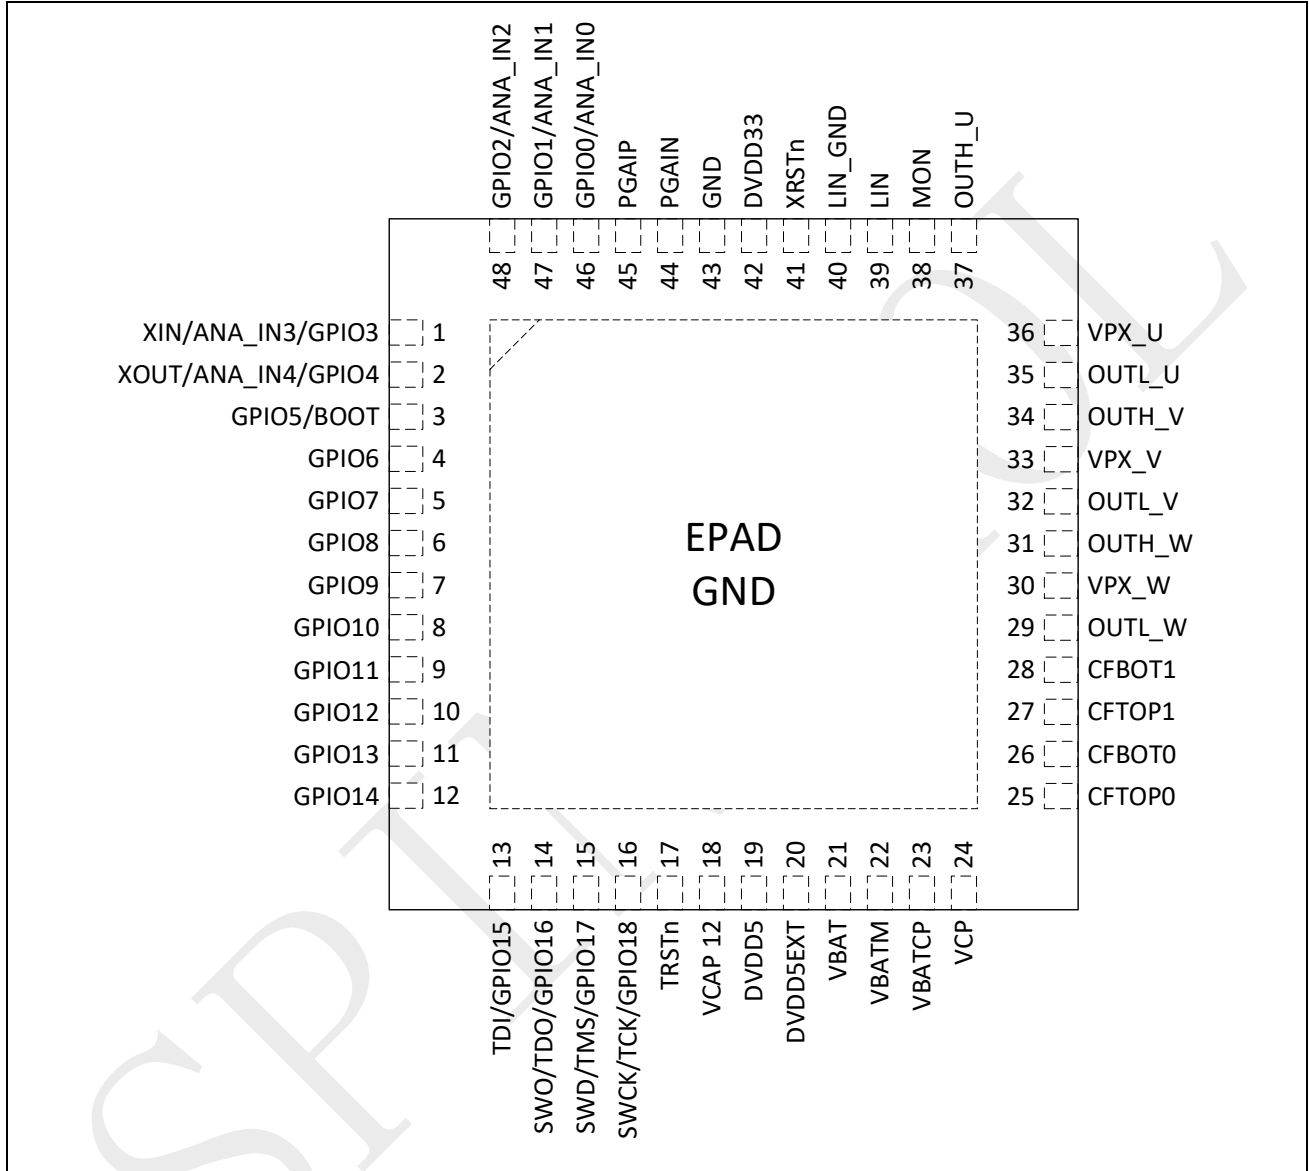

The SPD1179/SPD1176 has implemented a BEMF sensing module with following features:

- Implement U/V/W phase zero crossing detect
- BEMF detection scheme with the virtual neutral point

## 5 Electrical characteristics

### 5.1 Absolute maximum ratings

Table 5-1: Absolute maximum ratings<sup>[1][2]</sup>

Symbol	Parameter	Min	Max	Unit	
$V_{VBAT}$	Battery supply voltage for internal power system and LIN bus	-0.3	42	V	
$V_{VBATM}$	Battery supply voltage for internal pre-driver	-0.3	42	V	
$V_{VBATCP}$	Battery supply voltage for internal charge-pump	-0.3	42	V	
$V_{LIN}$	LIN bus interface, with respect to $V_{LIN\_GND}$	-28	42	V	
$V_{MON}$	High voltage input for level monitor	-28	42	V	
$V_{VCP}$	Charge-pump voltage	-0.3	52	V	
$V_{VPX\_X}$ <sup>[4]</sup>	Pre-driver floating ground	-10	42	V	
$V_{OUTH\_X}$ <sup>[4]</sup>	Pre-driver high side output	-10	51	V	
$V_{OUTH\_X}$ VS $V_{PX\_X}$ <sup>[4]</sup>	Pre-driver high side versus floating ground	-0.3	11 <sup>[5]</sup>	V	
$V_{OUTL\_X}$ <sup>[4]</sup>	Pre-driver low side output	-0.3	11 <sup>[5]</sup>	V	
$V_{DVDD5}$	DVDD5 voltage range for internal block	-0.3	7	V	
$V_{DVDD5EXT}$	VDD5EXT voltage range for external circuit	-0.3	7	V	
$V_{DVDD33}$	DVDD33 voltage range for internal MCU	-0.3	4.6	V	
$V_{VCAP12}$	VCAP12 voltage range for internal MCU core	-0.3	1.5	V	
$V_{IN\_5V}$	5V IO input voltage	-0.3	$V_{DVDD5}+0.3$	V	
$V_{IN\_3V}$	3.3V IO input voltage	-0.3	$V_{DVDD33}+0.3$	V	
$V_{LIN\_GND}$ <sup>[6]</sup>	LIN bus ground.	-0.3	0.3	V	
$I_{IC}$	Input clamp current	-20	+20	mA	
$I_{OC}$	Output clamp current	-20	+20	mA	
$T_J$	Junction temperature <sup>[3]</sup>	SPD1179	-40	+150	°C
		SPD1176	-40	+125	°C
$T_{stg}$	Storage temperature <sup>[3]</sup>	-65	+150	°C	

[2] Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these is not implied.

[3] All voltage values are with respect to  $V_{GND}$ , unless otherwise noted.

[4] Long-term high-temperature storage or extended use at maximum temperature conditions may result in a reduction of overall device life.

[5] X=U or V or W.

[6] Limited by design, internal circuit will turn on to clamp this voltage level.

[7] Short LIN\_GND and GND on PCB board.

$t_{\text{power-up}}^{[2]}$	Cold power-up time (to user's code)	-	-	9.1	-	ms

[1] It contain ~5.63ms for the RAM self-test.

[2] Compared with sleep mode exit time, it contain extra ~1.7ms POR time for VBAT.

## 5.5 Power consumption

### Typical current consumption

In active mode, the SPD1179/SPD1176 is placed under the following conditions:

- All I/O pins are in input mode and left unconnected;
- All peripherals (including analog module) are enabled;
- All peripheral clocks are as fast as HCLK (frequency division is 1), except DGCLK (Max 50 MHz);
- All clock modules are enabled;
- Select PLL clock as system clock source.
- Charge pump enable, Pre-driver toggle and no external driver MOS.
- GPIO5 is connected to GND

In stop mode, the SPD1179/SPD1176 is placed under the following conditions:

- All I/O pins are in input mode and left unconnected;
- All peripherals (including analog module) are clocked off or disabled;
- Clock modules (PLL, RCO, ROOSC and XO) are disabled;
- 5V/3.3V/1.2V LDOs are in low power mode;
- GPIO5 is connected to GND

In sleep mode, the SPD1179/SPD1176 is placed under the following conditions:

- All I/O pins are in input mode and left unconnected;
- All peripherals (including analog module) are disabled;
- Clock modules (PLL, RCO, ROOSC and XO) are disabled;
- 5V/3.3V/1.2V LDOs are shut down to 0V;
- GPIO5 is connected to GND

The typical operational current consumption over various HCLK frequency is shown in Figure 5-1.

**Figure 5-1: Typical operational current versus frequency**

## On-chip peripheral current consumption

The current consumption of the on-chip peripherals is given in Table 5-8. The MCU is placed under the following conditions:

- All I/O pins are in input mode and left unconnected;
- All peripherals(including analog module, RCO and XO) are disabled unless otherwise mentioned;
- The given value is calculated by measuring the current consumption
  - With all peripherals clocked disabled
  - With only one peripheral enabled

**Table 5-8: Peripheral current consumption**

Peripherals <sup>[1]</sup>	Conditions	Typ <sup>[2]</sup>	Unit
BOD	Select RCO as system clock source; All other peripherals are in default settings	106.0	uA

PLL	XO (32MHz) as HCLK source, $f_{PLL} = 100 \text{ MHz}$	961.0	uA
LIN transceiver	UART clock 100MHz, 19200bps	480.0	uA
DVDD5EXT	-	42.4	uA

[1] For peripherals with multiple instances, the current quoted is for single modules (result of average).

[2] Typical values are measured at  $T_A = 25 \text{ }^\circ\text{C}$ ,  $V_{BAT} = 12 \text{ V}$ .

[3] ADC analog current contain ADC analog module, bandgap and ADC reference buffer.

[4] The Bandgap must be enabled when enabling ADC (Analog Part), T-sensor, PGA, DAC and comparator.
